

# Resource Degradation and Rural Livelihood

# This is what we will discuss on

- The degradation of resources by the industries causes a great deal of difficulties for the rural livelihood.
- We shall demonstrate the various ways in which resources belonging to the rural people are being degraded, and what kind of difficulty it lands them onto.

- As new industries come up, land owned by the rural people is snatched away by the fat industry managers.

- Chop down the trees, blow out the mountains, to get the metals inside, use up all the water, wipe out the animals.
- We are running out of resources.
- In the past three decades alone one-thirds of the planets natural resources been consumed.
- In the us they have less than 4% of forests left.

- 40% of us waterways have become undrinkable.
- 80% of planet's original forestry is gone. 2000 trees a minute. 7 footballs fields.
- According to industries rural peopl don't even own the places & resources even if they have been living there for generations.

- If you don't own or buy then you don't have value.
- Rural people are thrown out of their area and the only way out for them is to work as workers in industris.
- They expose themseleves to reproductive toxis, etc. none care of their health,

- They live in slums. Have no other option . This is what happens in big cities of india as well (ex-mumbai)(200,000 people a day globally)
- Constant supply of workers available for industries. No matter how toxic that work may be.
- By products ; pollution. Kids in the congo pay with their future. Made to work in factories.
